

Problem Statement:

Students at UofSC have access to services that give them information about their lives, but it is spread out among multiple hosts. The goal is to provide students with one centralized web service that gives them information like grades, travel, classes, etc.

- The 4 W's
 - Who is experiencing the problem?
 - The students at a university.
 - What is the problem?
 - The university's content and services are spread across several different websites/hosts.
 - Where does this problem present itself?
 - The problem is present at any university that utilizes multiple hosts to communicate course information and university services to their students.
 - Why does it matter?
 - Attending a new university can be daunting for many students, and having the information for their classes and services in several different locations can make adjusting even more difficult. By compiling the classes and services into one centralized location, it would make using these services much easier and user friendly.
- Centralized college information crowdfunded by students
 - Would include the things like the following
 - Schoolwork (Blackboard-like service)
 - Laundry for students on campus
 - Various food spots (menus, open hours, ratings, etc)
 - Shuttles and their locations
 - Building locations
